

moodle Automated Testing

By: Alex Laughlin, Chandler Long and Andrew Nesbett

What is Moodle?

- Moodle is an open source learning management system (LMS)
- Moodle is used for e-learning
- Moodle is almost entirely written in PHP
- If you've used oaks then you know how it works

The screenshot shows the Moodle website homepage. At the top is the Moodle logo and a navigation menu with links: Solutions, Products, Pricing, Partners, Events, Community, News, About, and Contact. Below the logo, the text reads "Empowering educators with a flexible, open source LMS". To the right of this text is a circular image of a woman sitting cross-legged, using a laptop. Below the main text, there is a button that says "Watch the video". Further down, a section titled "The world's most popular learning platform, with hundreds of millions of users worldwide." features logos for United Nations, Monash University, The Open University, and World Vision. At the bottom, there are three columns: "K-12 Schools" with an image of children, "Higher Education" with an image of students, and "Workplace" with an image of two men working on a laptop.

moodle

Solutions Products Pricing Partners Events Community News About Contact

Empowering educators
with a flexible, open source LMS

Excel in collaborative learning using a world-class online learning management system.

Watch the video

The world's most popular learning platform, with **hundreds of millions of users** worldwide.

United Nations MONASH University The Open University World Vision

K-12 Schools
Moodle is used around the world by K-12 schools as an online learning platform.

Higher Education
The platform of choice for higher education institutions worldwide.

Workplace
Empower your team with an effective learning solution for training and development.

Project Goal

- The testing framework will be invoked by a single script
“./runAllTests.sh”
- The project compares the results from the output of the method to the oracle
- Results from the tests will then be showcased in a web browser

Test Case Format

This is an example of a test case
within our project

```
=====
# Testing number
# Requirement being tested
# Component being tested
# Method being tested
# Input for test cases
# Expected output (oracle)
=====
```

```
001
The tokenize method takes in a string and returns an array with the words indexed
projects/moodle/grade/grading/lib.php
tokenize
@@@
Array ( )
```

The Formatting

The test case will follow a simple but very specific format. If the format is broken then the tests will not run.

Test Number

Requirement

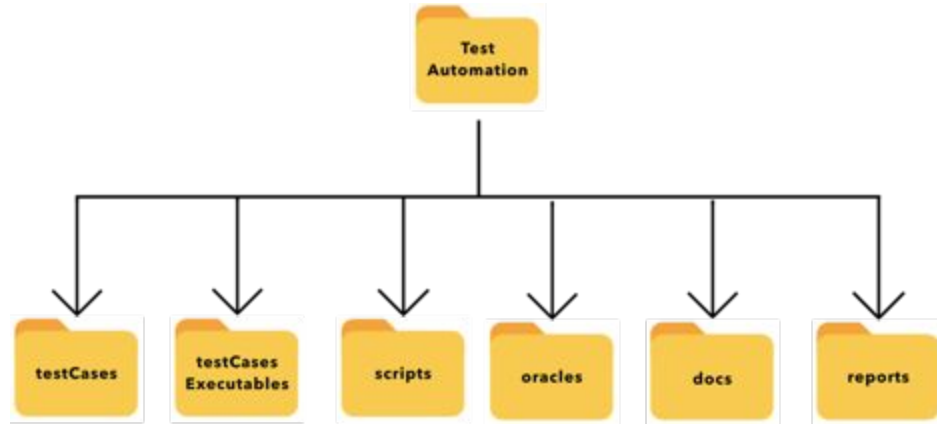

Component

Method

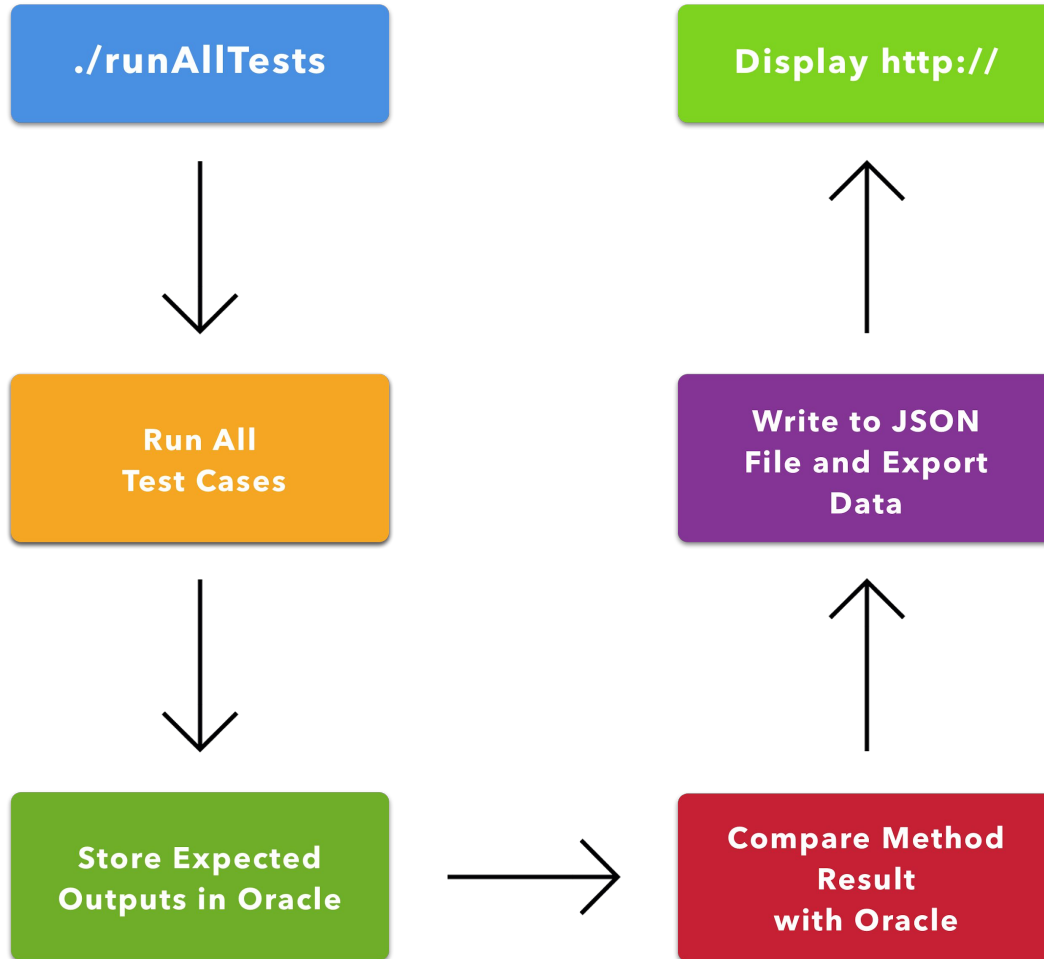

Input

Expected Output/Oracle

output.php

```
array_shift($argv);  
$className = array_shift($argv);  
$funcName = array_shift($argv);  
$result = call_user_func_array(array($className,  
$funcName), $argv);  
print_r($result)
```

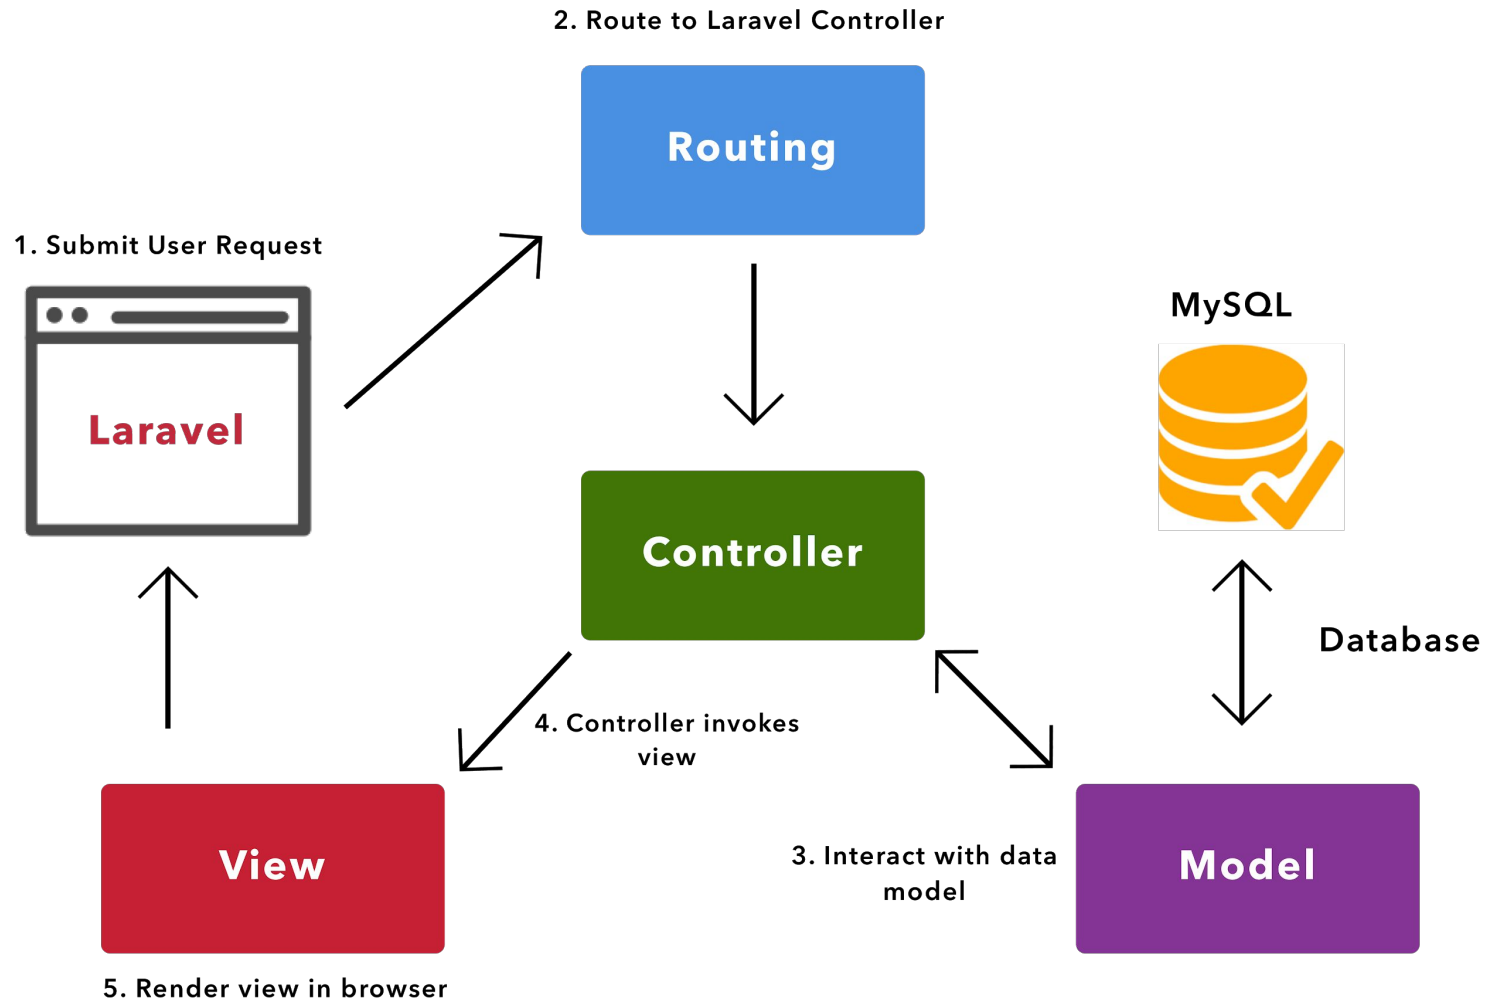

The Client Side

The PHP Framework for Web Artisans

Laravel is a web application framework with expressive, elegant syntax. We've already laid the foundation — freeing you to create without sweating the small things.

Demonstration of the Framework

Conclusion

Working with Moodle initially proved frustrating due to its size and complexity. Installing the software and its necessary dependencies took longer than anticipated due to unforeseen errors. Once installed and properly set up, we needed to find testable methods. Many of the methods rely on objects instantiated during normal use such as grade, student, class, etc. Luckily the method we found, `tokenize`, does not depend on any built objects found within the running Moodle project. Finding this method took up a lot of the time in our project, due to the fact that almost every method or function depends on other objects already created inside Moodle. Once this method was found, it was easy for us to start creating our bash script and create the necessary drivers to finish the automated test.
